# SUBSTANCES

vo.2 2015/10/21

#### A Chemical Database

#### Clemens NIEDERBERGER

http://www.mychemistry.eu/forums/forum/substances/

contact@mychemistry.eu

The **SUBSTANCES** package allows you to create a database like file that contains data of various chemicals. These data can be retrieved in the document. An index creation of the chemicals used in the document is directly supported.

## **Table of Contents**

I.	Preliminaries	2	6. Retrieving the Data	7

## Part I.

## **Preliminaries**

## 1. Licence and Requirements

Permission is granted to copy, distribute and/or modify this software under the terms of the LATEX Project Public License (LPPL), version 1.3 or later (http://www.latex-project.org/lppl.txt). The software has the status "maintained."

SUBSTANCES loads and needs the following packages: expl3 [L3Pa], xparse, xtemplate and l3keys2e [L3Pb]. It also needs the chemistry packages chemmacros [Nie15], chemfig [Tel15] and ghsystem [Nie14].

#### 2. About

The **SUBSTANCES** package allows you to create a database like file that contains data of various chemicals. These data can be retrieved in the document. An index creation of the chemicals used in the document is directly supported.

## Part II.

# **Package Description**

## 3. Options

The **SUBSTANCES** package has a few options:

draft = true|false
Default: false

If set to true all warnings will be errors.

final = true|false Default: true

The opposite of draft.

index = true|false
Default: false

Add index entries when \chem is called, see section 8.

 $style = {\langle style \rangle}$  Default: default

Load specific style, see sections 5 and A.

strict = true|false
Default: false

If set to true all warnings will be errors. This option overwrites any draft or final option that is passed on by the document class.

The most important option is **style**. Details concerning this option are explaind in sections 5 and A.

#### 4. The Database

#### 4.1. Declaring the Chemicals

The data about substances are stored via the command

```
\DeclareSubstance{\langle id \rangle}{\langle list\ of\ properties \rangle}
```

This declares substance  $\langle id \rangle$ .

An entry could look like this:

```
1 \DeclareSubstance{NaCl}{
2    name = Sodiumchloride ,
3    sum = NaCl ,
4    CAS = 7647-14-5,
5    mass = 58.44 ,
6    mp = 801 ,
7    bp = 1465 ,
8    phase = solid ,
9    density = 2.17
10 }
```

Changed in version 0.2

Such entries can either be declared in the document preamble or probably more useful in a database file. Such a file can be input in the document via

```
\LoadSubstances{\langle database name\rangle}
```

Input the database  $\langle database\ name \rangle$ . The name of a database file must follow the structure  $\langle database\ name \rangle$ . sub.

Suppose you have the file mydatabase.sub then you input it in the document preamble via  $LoadSubstances\{mydatabase\}$ .

#### 4.2. Available Fields

#### 4.2.1. Always Defined Fields

Below all fields defined by **SUBSTANCES** are listed.<sup>1</sup>

<sup>1.</sup> Look in the file substances-examples. sub which is part of this package and should be in the same place as this documentation for example uses.

```
name = \{\langle name \rangle\}  (required)
```

The IUPAC name of the substance. This is the only field that *has* to be used. The field's input is parsed with chemmacros' command \iupac.

```
sort = {\langle sort \ name \rangle}
```

If you plan to use the <u>index</u> option you should specify this field to get the sorting of the index right. This then creates index entries <u>\index</u>{\(\sigma \text{field}\)\end{\(\left)}\).

```
alt = {\langle alt \ name \rangle}
```

An alternative name. The field's input is parsed with chemmacros' command \iupac.

```
altsort = {\langle sort \ alt \ name \rangle}
```

This is the same as the **sort** field but for the alternative name.

```
CAS = \{\langle CAS \ number \rangle\}
```

The Chemical Abstract Service (CAS) number. The input needs to be input in the form  $\langle num \rangle - \langle num \rangle - \langle num \rangle$ .

```
PubChem = \{\langle PubChem \ number \rangle\}
```

The PubChem number.

The CAS field processes the number using the macro  $\CAS\{(number)\}\$  which is defined like this:

```
1 \def\@CAS#1-#2-#3\relax{\iupac{#1-#2-#3}}
2 \NewDocumentCommand\CAS{m}{\@CAS#1\relax}
```

You're free to redefine it to your needs.

```
4.2.2. Style-dependend Fields
```

**SUBSTANCES** defines the style default (see also sections 3, 5, and A) which is loaded if no other style has been specified. It defines the following additional fields and loads the packages chemfig [Tel15] and siunitx [Wri15].

```
formula = \{\langle formula \rangle\}
```

The molecular formula of the substance. The field's input is parsed with chemmacros' command \ch.

```
structure = \{\langle structure \rangle\}
```

The structural formula of the substance. The field's input is parsed with chemfig's command \chemfig.

```
mp = \{\langle melting point \rangle\}
  The melting point. The field's entry is input into the siunitx command \SI in the following
   way:
   SI{\langle field \rangle} \{ celsius \}.
bp = \{\langle boiling point \rangle\}
  The boiling point. The field's entry is input into the siunitx command \SI in the following way:
   SI{\langle field \rangle} \{ celsius \}.
density = \{\langle density \rangle\}
  The density. The field's entry is input into the siunitx command \SI in the following way:
   SI{\langle field \rangle} \{ gram per cmc \}.
phase = \{\langle phase \rangle\}
  The state of aggregation.
pKa = \{\langle pK_a \rangle\}
  The pK_a value. The field's entry is input into the siunitx command \num.
pKa1 = \{\langle pK_{a1} \rangle\}
  The first of several pK_a values. The field's entry is input into the siunitx command \num.
pKa2 = \{\langle pK_{a2} \rangle\}
  The second of several pK_a values. The field's entry is input into the siunitx command \normalfont{num}.
pKb = \{\langle pK_b \rangle\}
  The pK_b value. The field's entry is input into the siunitx command \num.
pKb1 = \{\langle pK_{b1} \rangle\}
  The first of several pK_h values. The field's entry is input into the siunitx command \num.
pKb2 = \{\langle pK_{b2} \rangle\}
  The second of several pK_b values. The field's entry is input into the siunitx command \num.
pictograms = \{\langle csv | list | of | pictograms \rangle\}
   The GHS pictograms. This field takes a list of pictogram names as they're input into ghsystem's
   command \ghspic [Nie14].
H = {\langle csv | list | of | hazard | statements \rangle}
  The H statements. This field takes a list of numbers as they're input into ghsystem's command
   \ghs{h}{\langle number\rangle}.
P = {\langle csv | list | of | precautionary | statements \rangle}
  The P statements. This field takes a list of pictogram names as they're input into ghsystem's
   command \ghs{p}{\langle number\rangle}.
EUH = \{\langle csv | list | of EUH | statements \rangle\}
  The EUH statements. This field takes a list of pictogram names as they're input into ghsystem's
   command \ghs{euh}{\langle number\rangle}.
```

```
LD50 = {\langle Median \ Lethal \ Dose \rangle}
```

The LD50 in mg kg $^{-1}$ . The field's entry is input into the siunitx command \SI in the following way:

 $SI\{\langle field \rangle\}\{\{ili \rangle\}\}$ 

## 5. Define Custom Styles

#### 5.1. Background

You might have other needs for fields than the ones defined by **SUBSTANCES** and the default style. All fields except the required name field whixh are explained in this manual are defined by the default style.

You can easily define your own style which means that you save a file with the name substances- $\langle style \rangle$ . def. In it you both define the commands you need and you declare substance properties with the command \DeclareSubstanceProperty (which is explained in section 5.2) to declare your own fields.

Such a style file should start with a \SubstancesStyle declaration:

#### \SubstancesStyle\*{\langle style name\rangle}

Introduced in version 0.2

This declares the style *(style name)*. The starred version also switches to the expl3 programming environment. Either way @ has category code 11 in a style file.

#### \LoadSubstancesStyle{\langle style name\rangle}

Introduced in version 0.2

This loads the style (*style name*). It can be used inside of a style file. This can be useful if you want to extend the default style without copy-pasting every definition of the default style. Outside of a style file this command does nothing.

The implementation of the default style is shown in section A as an example.

#### 5.2. Declare New Fields or Change Existing Fields

You might want other fields or change the definition of the predefined ones. For this there's

```
\DeclareSubstanceProperty*{\langle field\ name\rangle}[\langle pre\ code\rangle][\langle post\ code\rangle]
```

This command declares a new property field for a substance. The star makes the property a required one which means an error will be issued if a substance is declared without it. The optional arguments  $\langle pre\ code \rangle$  and  $\langle post\ code \rangle$  specify any code that should be input directly before or after the field entry, respectively. The  $\langle pre\ code \rangle$  may end with a command that takes one mandatory argument. In this case the field entry will be its argument.

The following example would define a field EC which uses a custom command to parse the field entry. The European Commission Number (EC) is assigned to chemical substances for regulatory purposes within the European Union by the regulatory authorities.

```
1 \makeatletter
2 \def\@EC#1-#2-#3\relax{#1-#2-#3}
3 \newcommand*\EC[1]{\@EC#1\relax}
4 \makeatother
5 \DeclareSubstanceProperty{EC}[\EC]
```

For further examples of the usage of pre and post code look at the definition of the name and the mp field:

```
1 \DeclareSubstanceProperty*{name}[\iupac]
2 \DeclareSubstanceProperty{mp}[\SI][{\celsius}]
```

## 6. Retrieving the Data

There are two commands defined by **SUBSTANCES** that allow the retrieving of the data. The command \chem is intended as user command, the command \GetSubstanceProperty can be used to define your own user command (perhaps in your own style file, see section 5).

```
\chem*[\langle pre \rangle][\langle post \rangle]\{\langle id \rangle\}[\langle property \rangle]
```

If the command \chem is called without the optional  $\langle property \rangle$  argument the name entry will be called. The starred version calls the alt entry if it is defined and the name entry otherwise. The arguments  $\langle pre \rangle$  and  $\langle post \rangle$  add arbitrary input before or after the output, respectively.

```
\GetSubstanceProperty\{\langle id \rangle\}\{\langle property \rangle\}
Retrieves \langle property \rangle for substance \langle id \rangle.
```

All of the next examples use the data defined in the file substances-examples.sub that is part of this package, see section B.

```
1 \chem{H2S04}[structure] \newline
2 \chem{H2S04} has the boiling point $\chem[T_b =]{H2S04}[bp]$ and a
3 density of $\chem[\rho =]{H2S04}[density]$.

4
5 Compare the melting points of methane and ethane,
6 $\chem[T_m=]{methane}[mp]$ and $\chem[T_m=]{ethane}[mp]$,
7 with the boiling points $\chem[T_b=]{methane}[bp]$ and
8 $\chem[T_b=]{ethane}[bp]$.

9
10 \chem{NaCl} has the \ac{CAS} number \chem{NaCl}[CAS].
```

```
\text{chem{acetone} (\chem*{acetone}) is the most simple ketone: \\ \frac{13}{14} \chem{acetone}[structure] \\ \frac{1}{10} \quad \text{H} \\ \text{O} \quad \text{S} \quad \text{D} \\ \text{O} \quad \text{H} \\ \text{O} \quad \text{S} \quad \text{D} \\ \text{O} \quad \text{D} \\ \text{C} \quad \text{D} \\ \text{C} \quad \text{ad a density of } \rho = 1.8356 \text{ g cm}^{-3}. \\ \text{C ompare the melting points of methane and ethane, } T_m = -182 \circ \text{C} \text{ and } T_m = -183 \circ \text{C}, \\ \text{with the boiling points } T_b = -162 \circ \text{C} \text{ and } T_b = -89 \circ \text{C}. \\ \text{Sodiumchloride has the CAS number } 7647-14-5. \\ \text{Propanone (Acetone) is the most simple ketone:} \end{align*}
```

The following code creates table 1.

```
1 \begin{table}[htp]
    \centering
    \qhssetup{hide}
    \sisetup{scientific-notation=fixed,fixed-exponent=0,per-mode=symbol}
    \begin{tabular}{l>{\raggedright\arraybackslash}p{.6\linewidth}}
      \toprule
        name
                           & \chem{methane} \\
        formula
                           & \chem{methane}[formula] \\
                           & \chem{methane}[structure] \\
      \midrule

H statements H220

P statements P210, P377, P381, P410 + P403

TABLE 1: All properties of Methane that have been saved in the example database.

#### 7. Additional Commands

**SUBSTANCES** provides a few commands that maybe are useful in building custom macros for styles. A field exists if it has been defined with \DeclareSubstanceProperty regardless if it has been used or not. A substance exists if it has been defined with \DeclareSubstance.

#### $\GetSubstanceProperty{\langle id \rangle}{\langle field \rangle}$

Retrieve the property specified in  $\langle field \rangle$  for substance  $\langle id \rangle$ . This command is *not* expandable.

#### \* \RetrieveSubstanceProperty{\langle id\rangle} {\langle field\rangle}

The same as \GetSubstanceProperty but expandable.

#### \*\ForAllSubstancesDo{\langle code \rangle}

Loops through all existing substances. Inside  $\langle code \rangle$  #1 may be used to refer to the  $\langle id \rangle$  of the current substance. This command is expandable.

#### 7. Additional Commands

#### \* \AllSubstancesSequence

A sequence of all substances. This is a sequence of balanced groups each containing the  $\langle id \rangle$  of a substance. This command is expandable.

#### \* \AllSubstancesClist

A comma separated list of all substances. Every  $\langle id \rangle$  is separated from the next with a comma. This command is expandable.

#### \* $\IfSubstancePropertyTF{(id)}{(field)}{(true\ code)}{(false\ code)}$

Tests if the property  $\langle field \rangle$  is defined for the substance  $\langle id \rangle$  and returns either  $\langle true\ code \rangle$  or  $\langle false\ code \rangle$ . This command is expandable.

#### \* \IfSubstancePropertyT{\langle id\rangle} \{\langle true code\rangle}

Tests if the property  $\langle field \rangle$  is defined for the substance  $\langle id \rangle$  and returns  $\langle true\ code \rangle$  if it is. This command is expandable.

#### \* \IfSubstancePropertyF{\langle id\rangle} \{\langle field\rangle} \{\langle false code\rangle}

Tests if the property  $\langle field \rangle$  is defined for the substance  $\langle id \rangle$  and returns  $\langle false\ code \rangle$  if it isn't. This command is expandable.

#### \* \IfSubstanceFieldTF{\langle field\rangle} \{\langle true code\rangle\} \{\langle false code\rangle\}

Tests if the property  $\langle field \rangle$  exists and returns either  $\langle true\ code \rangle$  or  $\langle false\ code \rangle$ . This command is expandable.

#### \* \IfSubstanceFieldT{\langle field\rangle} \{\langle true code\rangle}

Tests if the property (field) exists and returns (true code) if it does. This command is expandable.

#### \* \IfSubstanceFieldF{\langle field\rangle} \{\langle false code\rangle\}

Tests if the property  $\langle field \rangle$  exists and returns  $\langle false\ code \rangle$  if it doesn't. This command is expandable.

#### \* \IfSubstanceExistTF{\langle id\rangle} \{\langle true code \rangle} \{\langle false code \rangle}

Tests if the substance  $\langle id \rangle$  exists and returns either  $\langle true\ code \rangle$  or  $\langle false\ code \rangle$ . This command is expandable.

#### \* \IfSubstanceExistT $\{\langle id \rangle\}$ $\{\langle true\ code \rangle\}$

Tests if the substance  $\langle id \rangle$  exists and returns  $\langle true\ code \rangle$  if it does. This command is expandable.

#### \* \IfSubstanceExistF{\langle id\rangle} \{\langle false code\rangle}

Tests if the substance  $\langle id \rangle$  exists and returns  $\langle false\ code \rangle$  if it doesn't. This command is expandable.

- 1 Just to demonstrate how these commands can be used. And to get
- 2 our demonstration index filled.\par
- 3 \newcounter{substances}
- ₄ \ForAllSubstancesDo{%
- 5 \ifnum0=\value{substances}\relax

```
6  \else,
7  \fi
8  \stepcounter{substances}%
9  \chem{#1}%
10  \IfSubstancePropertyT{#1}{alt}{ (\chem*{#1})}%
11 }
```

Just to demonstrate how these commands can be used. And to get our demonstration index filled.

Sodiumchloride, Hydrochloric Acid, Nitric Acid, Sulfuric Acid, Methane, Ethane, Propane, Butane (*n*-Butane), Pentane (*n*-Pentane), Hexane (*n*-Hexane), Heptane (*n*-Heptane), Octane (*n*-Octane), Nonane (*n*-Nonane), Decane (*n*-Decane), Propanone (Acetone)

#### 8. Create an Index

When **SUBSTANCES** is called with **index** = {true} the command \chem will add index entries each time it is used. In this case the entries of the fields name, sort, alt and altsort will be expanded during the process. You should keep that in mind if some error arises. It might be due to a \textbf or similar in your database. In this case you either need to replace it with some robust command or put a \noexpand in front of it.

Alternative names as specified in the alt also get an index entry with a reference to the one of the corresponding name field. The entry of the name field in this case gets the alt name appended in braces.

This behaviour is not customizable for the time being. It is planned for future versions of this package, though.

As a demonstration an index for all chemicals used in this documentation is created with the help of the package imakeidx [Gre13].

#### 8.1. Formatting Commands

The index entries are formatted with the following commands. You can redefine them to your needs. If you do make sure they have the same number of required arguments and are expandable!

\*\SubstanceIndexNameEntry{\langle sort\rangle} \{\langle name\rangle}

Formats the name if no alt field is given. The default definition is #1@#2.

\* \SubstanceIndexNameAltEntry $\{\langle sort \rangle\}$  $\{\langle name \rangle\}$  $\{\langle alt \rangle\}$ 

Formats the name if the alt field is given. The default definition is #1@#2 (#3).

\* \SubstanceIndexAltEntry{\langle alt sort\rangle} \{\langle name\rangle} \{\langle alt\rangle}

Formats the entry for the alt field. The default definition is #1@#3|see#2

#### 8.2. Using makeidx

Using the option index =  $\{true\}$  with the standard way to create an index will add the entries  $\{name\}$  to the index. This means you would mix them with other entries if you have any. Below a sample document is shown.

```
1 \documentclass{article}
2 \usepackage[T1]{fontenc}
3 \usepackage[index]{substances}
4 \LoadSubstances{substances-examples}
5
6 \usepackage{makeidx}
7 \makeindex
8 \begin{document}
9
10 \newcounter{substances}
11 \ForAllSubstancesDo{%
12 \ifnum0=\value{substances}\relax
13 \else, \fi
14 \stepcounter{substances}\chem{#1}
15 }
16
17 \printindex
18 \end{document}
```

#### 8.3. Using splitidx

Maybe a seperate index for the chemicals will make more sense. In this case you could use the package splitidx [Koh13]. **SUBSTANCES** will recognize this and create \sindex[\jobname-chem]{\(\name\)}\) entries each time \chem is used.

```
1 \documentclass{article}
2 \usepackage[T1]{fontenc}
3 \usepackage[index]{substances}
4 \LoadSubstances{substances-examples}
5
6 \usepackage{splitidx}
7 \makeindex
8 \newindex[Chemicals]{\jobname-chem}
9 \begin{document}
10
11 \newcounter{substances}
12 \ForAllSubstancesDo{%
```

```
\ifnum0=\value{substances}\relax
\( \else, \fi \)
\stepcounter{substances}\chem{#1}
\( i \)
\( \frac{1}{2} \)
\( \
```

#### 8.4. Using imakeidx

Another way to create multiple indexes is the package imakeidx [Gre13]. **SUBSTANCES** recognizes its usage and creates index entries  $\index[\jobname-chem] {\langle name \rangle}$ .

```
1 \documentclass{article}
2 \usepackage[T1]{fontenc}
3 \usepackage[index]{substances}
4 \LoadSubstances{substances-examples}
5
6 \usepackage{imakeidx}
7 \makeindex[name=\jobname-chem,title=Chemicals]
8 \begin{document}
9
10 \newcounter{substances}
11 \ForAllSubstancesDo{%
12 \ifnum0=\value{substances}\relax
13 \else, \fi
14 \stepcounter{substances}\chem{#1}
15 }
16
17 \printindex[\jobname-chem]
18 \end{document}
```

## Part III.

# **Appendix**

## A. The Default Style

The following code shows the contents of the file substances-default.def which defines the default style which is part of this package.
